AMD081GSDQN8

AlfaMemory

8G Bytes (1024M x 64 bits)
based on 8 pcs 1024M x 8 DDR4 SDRAM
260pin PC4-25600 DDR4 Unbuffered SO-DIMM Non-ECC

Specifications

- RoHS Compliant (Lead Free) Memory module
- Density: 8GB
- Organization
  — 1024M x 64 bits, 1 Rank
- Mounting 8 pieces of 8G bits DDR4 SDRAM sealed In FBGA
- Package: 260-pin, Small Outline Dual in-line memory module (SO-DIMM) — PCB height: 30.00mm
  — PCB Gold Plating: 3u” min
- Power Supply: VDD=1.2V (1.14V to 1.26V)
- VDDQ = 1.2V (1.14V to 1.26V)
- VPP = 2.5V (2.375V to 2.75V)
- VDDSPD=2.25V to 2.75V
- Functionality and operations comply with the DDR4 SDRAM datasheet
- 16 internal banks
- Bank Grouping is applied, and CAS to CAS latency (tCCD_L, tCCD_S) for the banks in the same or different bank group accesses are available
- Fast data transfer rates: PC4-25600
- Bi-Directional Differential Data Strobe
- 8 bit pre-fetch
- Burst Length (BL) switch on-the-fly BL8 or BC4(Burst Chop)
- CAS (READ) latency (CL): 14, 15, 16, 17, 18,19 ,20 ,21 ,22
- On-Die Termination (ODT)
- Terminated control command and address bus
- Tcase of 0°C to 95°C (Components)
  — 64ms, 8,192 cycle refresh at 0°C to 85°C — 32ms at 85°C to 95°C
- Operating Temperature (Tcase) — TOPR = 0°C to +85°C
- Fly-by topology

Key Parameters

MT/s	tCK (ns)	CAS Latency (tCK)	tRCD (ns)	tRP (ns)	tRAS (ns)	tRC (ns)	CL-tRCD-tRP

Pin Descriptions

Pin Name	Description	Pin Name	Description
A0-A16	SDRAM address bus	SCL	I2C serial bus clock for SPD/TS and register
BA0, BA1	SDRAM bank select input	SDA	I2C serial data line for SPD/TS and register
BG0, BG1	SDRAM bank group select input	SA0-SA2	I2C slave address select for SPD/TS and register
RAS_n2	SDRAM row address strobe input	PAR	SDRAM parity input
CAS_n3	SDRAM column address strobe input	VDD	SDRAM core power
WE_n4	SDRAM write enable input		
CS0_n, CS1_n, CS2_n, CS3_n	DIMM Rank Select Lines input	12V	Optional Power Supply on socket but not used on RDIMM
CKE0, CEK1	SDRAM clock enable lines input	VREFCA	SDRAM command/address reference supply
ODT0, ODT1	SDRAM on-die termination control lines input	VSS	Power supply return (ground)
ACT_n	SDRAM input for activate input	VDDSPD	Serial SPD/TS positive power supply
DQ0-DQ63	DIMM memory data bus	ALERT_n	SDRAM ALERT_n output
CB0-CB7	DIMM ECC check bits	VPP	SDRAM Supply
TDQS9_t-TDQS17_t TDQS_c-TDQS17_c	Dummy loads for mixed populations of x4 based and x8 based RDIMMs.		
DQS0_t-DQS17_t	Data Buffer data strobes (positive line of differential pair)	RESET_n	Set SDRAM and SDRAMs to a Known State
DBI0_n-DBI8_n	Data Bus Inversion	EVENT_n	SPD signals a thermal event has occurred
CK0_t, CK1_t	SDRAM clock input (positive line of differential pair)	VTT	SDRAM I/O termination supply
CK0_c, CK1_c	SDRAM clock input (negative line of differential pair)	RFU	Reserved for future use

1. RAS_n is a multiplexed function with A16.
2. CAS_n is a multiplexed function with A15.
3. WE_n is a multiplexed function with A14.

Input/Output Functional Descriptions

Symbol	Type	Function
CK_t, CK_c	Input	Clock: CK_t and CK_c are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK_t and negative edge of CK_c.
CKE, (CKE1)	Input	Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is asynchronous for Self-Refresh exit. After VREFCA and VREFDQ have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, CK_c, ODT and CKE, are disabled during power-down. Input buffers, excluding CKE, are disabled during Self-Refresh.
CS_n, (CS1_n)	Input	Chip Select: All commands are masked when CS_n is registered HIGH. CS_n provides for external Rank selection on systems with multiple Ranks. CS_n is considered part of the command code.
C0,C1,C2	Input	Chip ID: Chip ID is only used for 3DS for 2,4,8high stack via TSV to select each slice of stacked compnent. Chip ID is considered part of the command code.
ODT, (ODT1)	Input	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR4 SDRAM. When enabled, ODT is only applied to each DQ, DQS_t, DQS_c and DM_n/DBI_n/TDQS_t,NU/TDQS_c (When TDQS is enabled via Mode Register A11=1 in MR1) signal for x8 configurations. For x16 configuration ODT is applied to each DQ, DQSU_c, DQSU_t, DQSL_t, DQSL_c, DMU_n, and DML_n signal. The ODT pin will be ignored if MR1 is programmed to disable RTT_NOM.
ACT_n	Input	Activation Command Input: ACT_n defines the Activation command being entered along with CS_n. The input into RAS_n/A16, CAS_n/A15 and WE_n/A14 will be considered as Row Address A16, A15 and A14.
RAS_n/A16, CAS_n/A15, WE_n/A14	Input	Command Inputs RAS_n/A16, CAS_n/A15 and WE_n/A14 (along with CS_n) define the command being entered. Those pins have multi function. For example, for activation with ACT_n Low, those are Addressing like A16,A15 and A14 but for non-activation command with ACT_n High, those are Command pins for Read, Write and other command defined in command truth table.
DM_n/DBI_n/ TDQS_t, (DMU_n/DBIU_n), (DML_n/DBIL_n)	Input/ Output	Input Data Mask and Data Bus Inversion: DM_n is an input mask signal for write data. Input data is masked when DM_n is sampled LOW coincident with that input data during a Write access. DM_n is sampled on both edges of DQS. DM is muxed with DBI function by Mode Register A10,A11,A12 setting in MR5. For x8 device, the function of DM or TDQS is enabled by Mode Register A11 setting in MR1. DBI_n is an input/output identifing wherther to store/output the true or inverted data. If DBI_n is LOW, the data will be stored/output after inversion inside the DDR4 SDRAM and not inverted if DBI_n is HIGH. TDQS is only supported in x8.
BG0 - BG1	Input	Bank Group Inputs: BG0 - BG1 define to which bank group an Active, Read, Write or Precharge command is being applied. BG0 also detemines which mode register is to be accessed during a MRS cycle. x4/8 have BG0 and BG1 but x16 has only BG0.

Input/Output Functional Descriptions

Symbol	Type	Function
BA0 - BA1	Input	Bank Address Inputs: BA0 - BA1 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines if the mode register or extended mode register is to be accessed during a MRS cycle.
A0 - A16	Input	Address Inputs: Provied the row address for ACTIVATE Commands and the column address for Read/Write commands th select one location out of the memory array in the respective bank. (A10/AP, A12/BC_n, RAS_n/A16, CAS_n/A15 and WE_n/A14 have additional functions, see other rows. The address inputs also provide the op-code during Mode Register Set commands.
A10 / AP	Input	Auto-precharge: A10 is sampled during Read/Write commands to determine whether Autoprecharge should be performed to the accessed bank after the Read/Write operation. (HIGH: Autoprecharge; LOW: no Autoprecharge).A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 / BC_n	Input	Burst Chop: A12 / BC_n is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (HIGH, no burst chop; LOW: burst chopped). See command truth table for details.
RESET_n	Input	Active Low Asynchronous Reset: Reset is active whenRESET_n is LOW, and inactive when RESET_n is HIGH. RESET_n must be HIGH during normal operation. RESET_n is a CMOS rail to rail signal with DC high and low at 80% and 20% of V_{DD}.
DQ	Input/ Output	Data Input/ Output: Bi-directional data bus. If CRC is enabled via Mode register then CRC code is added at the end of Data Burst. Any DQ from DQ0~DQ3 may indicate the internal Vref level during test via Mode Register Setting MR4 A4=High. Refer to vendor specific datasheets to determine which DQ is used.
DQS_t, DQS_c, DQSU_t, DQSU_c, DQSL_t, DQSL_c	Input/ Output	Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. For x16, DQSL corresponds to the data on DQL0-DQL7; DQSU corresponds to the data on DQU0-DQU7. The data strobe DQS_t, DQSL_t, and DQSU_t are paired with differential signals DQS_c, DQSL_c, and DQSU_c, respectively, to provide differential pair signaling to the system during reads and writes. DDR4 SDRAM supports differential data strobe only and does not support single-ended.
TDQS_t, TDQS_c	Output	Termination Data Strobe: TDQS_t/TDQS_c is applicable for x8 DRAMs only. When enabled via Mode Register A11 = 1 in MR1, the DRAM will enable the same termination resistance function on TDQS_t/TDQS_c that is applied to DQS_t/DQS_c. When disabled via mode register A11 = 0 in MR1, DM/DBI/TDQS will provide the data mask function or Data Bus Inversion depending on MR5; A11, 12, 10 and TDQS_c is not used. x4/x16 DRAMs must disable the TDQS function via mode register A11 = 0 in MR1.
PAR	Input	Command and Address Parity Input : DDR4 Supports Even Parity check in DRAMs with MR setting. Once it's enabled via Register in MR5, then DRAM calculates Parity with ACT_n, RAS_n/A16, CAS_n/A15, WE_n/A14, BG0-BG1, BA0-BA1, A17-A0. Input parity should maintain at the rising edge of the clock and at the same time with command & address with CS_n LOW.

Input/Output Functional Descriptions

Symbol	Type	Function
ALERT_n	Output	Alert: It has multi functions such as CRC error flag, Command and Address Parity error flag. If there is error in CRC, then Alert_n goes LOW for the period time interval and goes back HIGH. IF there is error in Command Address Parity Check, then Alert_n goes LOW for relatively long period until on going DRAM internal recovery transaction to complete.
TEN	Input	Bourdary Scan Mode Enable: Required on x16 devices and optional input on x4/x8 with densities equal to or greater than 8Gb. HIGH in this pin will enable boundary scan operation along with other pins. It is a CMOS rail to rail signal with DC high and low at 80% and 20% of VDD.
NC		No Connect: No internal electrical connection is present.
V_{DDQ}	Supply	DQ Power Supply: 1.2 V +/- 0.06 V
V_{SSQ}	Supply	DQ Ground
V_{DD}	Supply	Power Supply: 1.2 V +/- 0.06 V
V_{SS}	Supply	Ground
V_{pp}	Supply	DRAM Activation Power Supply: 2.5V (2.375V min , 2.75 max)
V_{REFCA}	Supply	Reference voltage for CA
ZQ	Supply	Reference Pin for ZQ calibration

Note: Input only pins (BG0-BG-1, BA0-BA1, A0-A17, ACT_n, RAS_n,/A16, CAS_n/A15, WE_n/A14, CS_n, CKE, ODT, and RESET_n) do not supply termination.

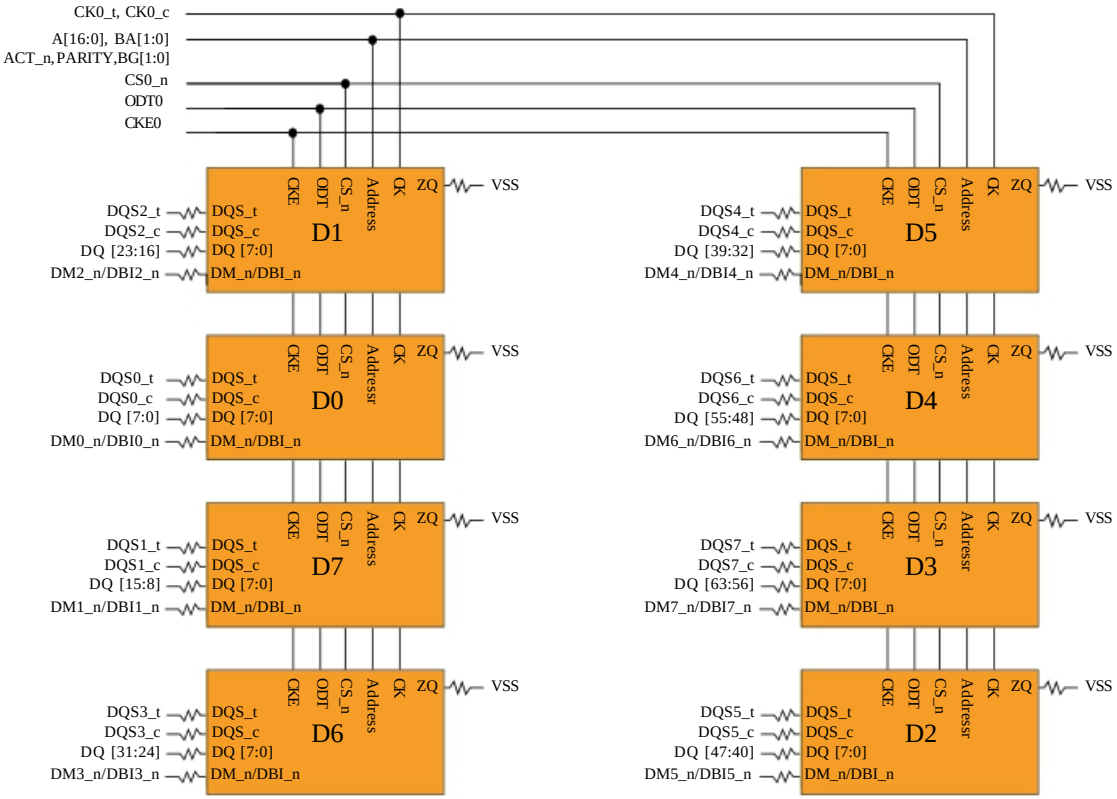
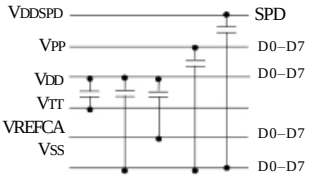
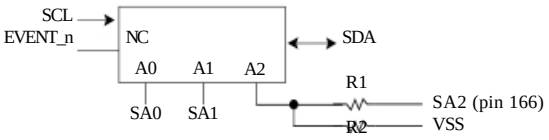
Functional Block Diagram





Serial PD with Thermal sensor



Note:

1. Unless otherwize noted, resistor values are 15 Ω±5%.
2. ZQ resistors are 240Ω±1%.For all other resistor values refer to the appropriate wiring diagram.
3. To connect the SPD A2 input to the edge connector pin 166 install R1. To tie the SPD input A2 to ground install R2. Do not install both R1 and R2. The values for R1 and R2 are not critical. Any value less than 100 Ohms may be used.
